CONCEPT: This algebra workbook has a creative twist: A picture of a Cuddly Bear is used in place of a boring old X for the unknown. The idea behind adding this artistic touch to the equations is to help make algebra seem a little more fun and enjoyable. Students don't need to draw bears in their solutions, though - they can write X if they want. However, there is an opportunity for students to be creative - for example, they could draw smiley faces instead of X's.

INSTRUCTION: The staff at Al-Bear Einstein developed a concise, one-page introduction to each chapter that explains what to do in simple terms and provides an instructive example to serve as a guide. The description emphasizes the underlying concept, like dividing both sides by the same number. The material is presented in stages: A new technique is introduced in each stage, allowing students to focus on and master one idea at a time. Review sections help to reinforce the older material and force students to learn when to apply the various techniques. The Cuddly Bears drawn by artist Bearlyn help to engage

student interest and make the learning process fun.

STRUCTURE: This workbook offers plenty of practice applying basic algebra skills to solve equations. The problems start out simple, like $X + 4 = 12$, and progressively advance, culminating in equations like $3X + 8 = 9X - 16$ (but with Cuddly Bears instead of X's). The problems are written in a large font.

ANSWERS: Teachers or parents can check the answers at the end of the workbook. **LEVEL.** This workbook focuses on basic algebra skills. No prior experience with algebra is needed. The goal is to learn how to solve for one unknown in a linear equation using basic arithmetic operations. All of the answers are positive integers. There are no fractions. All of the problems can be solved without a calculator with elementary arithmetic with the numbers 1 thru 9. This way, students can focus on the main idea without distracting complications.

CONTENTS: The stages of this workbook are presented as follows: This workbook begins with simple equations that can be solved with a single arithmetic operation, like adding a constant to both sides. Each of the first four sections focuses on a different operation. This allows students to master one technique at a time. A review section mixes the four operations together. The next section combines operations together. For example, it may be necessary to first subtract a number from both sides and then divide both sides by a number. Students next learn how to add the unknown to both sides of the equation in order to solve the problem. The last section offers ample practice with equations of the form $3X + 8 = 23 - 2X$. Students must add or subtract both constants and unknowns to/from both sides of the equation in order to solve these

Students learn how to think about multiplying polynomials in reverse order, which is known as factoring. They analyze factoring patterns that occur when a polynomial has a special structure like a difference of squares or a perfect square trinomial. They learn how to use factoring to solve quadratic equations and then they apply what they have learned as they solve a wide variety of scenarios that involve quadratic relationships. Near the end of the book, students are introduced to simplifying rational expressions, which they will study in more depth in Algebra 2: Book 4. They also learn about graphing parabolas, which they will study in more depth in Algebra 2: Book 3. Student

Learn common core high school Algebra 1 after only 30 hours of study. This textbook covers every concept in high school Algebra 1 in only 120 pages. Typical high school Algebra textbooks can be over 800 pages long, full of complex theorems and postulates.

Working as an engineer for a major international shipping company, the author has spent his entire career explaining complex subjects to senior (and highly paid) executives. If he used a "typical math textbook" approach to communicating with executives, he would have lost his job a long time ago. Executives, it is believed, are very busy - and they need quick and concise explanations to make quick and well-informed decisions. But are high school students any different? Do they have endless time to read 800 pages of postulates and theorems that have no application to modern work? This textbook is written as an anecdote to these problems, and to meet the needs of a modern high school student.
