We currently live in a world filled with videos. There are videos on YouTube, feature movies and even videos recorded with our own cameras and smartphones. These videos present an excellent opportunity to not only explore physical concepts, but also inspire others to investigate physics ideas. With video analysis, we can explore the fantasy world in science-fiction films. We can also look at online videos to determine if they are genuine or fake. Video analysis can be used in the introductory physics lab and it can even be used to explore the make-believe physics embedded in video games. This book covers the basic ideas behind video analysis along with the fundamental physics principles used in video analysis. The book also includes several examples of the unique situations in which video analysis can be used.

Christopher Hitchens, described in the London Observer as "one of the most prolific, as well as brilliant, journalists of our time" takes on his biggest subject yet–the increasingly dangerous role of religion in the world. In the tradition of Bertrand Russell's Why I Am Not a Christian and Sam Harris's recent bestseller, The End Of Faith, Christopher Hitchens makes the ultimate case against religion. With a close and erudite reading of the major religious texts, he documents the ways in which religion is a man-made wish, a cause of dangerous sexual repression, and a distortion of our origins in the cosmos. With eloquent clarity, Hitchens frames the argument for a more secular life based on science and reason, in which hell is replaced by the Hubble Telescope's awesome view of the universe, and Moses and the burning bush give way to the beauty and symmetry of the double helix. From the Hardcover edition.

"I'm loving it! Laura has managed not only to write a clear and incredibly important book, she's really funny too! Her way of writing, the images in her language, and the diagrams make this book really stand out; there's no way to misunderstand the concepts she's presenting." -- Emelie Johnson Vegh, co-author of Agility Right from the Start Some dogs need a little help. Some dogs are afraid, or excited, or reactive. Dogs that "don't listen" and "go crazy" don't live the lives we –- or they –- want. Fired Up, Frantic, and Freaked Out can change that. Simple steps and an accessible, conversational tone from award-winning, internationally-known trainer Laura VanArendonk Baugh CPDT-KA KPACTP make calming the agitated dog not only possible, but pleasant. Inside you'll learn how to Achieve change in short, simple training sessions of a minute or less Maximize the effects of natural brain chemistry Know when to call in medical help "Clean up" unreliable behaviors in both overexcited sport dogs and pets at home Recognize how fear, aggression, and excitement are variants of the same root problem The conversational tone is both informative and fun — very accessible, and it feels like the reader has a consulting trainer standing at her shoulder! Bring your dog from emotional to thoughtful, and enjoy a calmer, more enriched life with your best friend.

Siddhartha is a 1922 novel by Hermann Hesse that deals with the spiritual journey of self-discovery of a man named Siddhartha during the time of the Gautama Buddha. The book, Hesse's ninth novel, was written in German, in a simple, lyrical style. It was published in the U.S. in 1951 and became influential during the 1960s. Hesse dedicated the first part of

it to Romain Rolland and the second to Wilhelm Gundert, his cousin. The word Siddhartha is made up of two words in the Sanskrit language, siddha (achieved) + artha (what was searched for), which together means "he who has found meaning (of existence)" or "he who has attained his goals". In fact, the Buddha's own name, before his renunciation, was Siddhartha Gautama, Prince of Kapilvastu. In this book, the Buddha is referred to as "Gotama".

In their first, bestselling, book Maths for Mums and Dads Rob Eastaway and Mike Askew helped you and your child make sense of the new methods and topics covered in primary school maths. But as your child embarks on secondary school, two new issues arise. First, in the build-up to GCSE, school children begin to do maths that you probably have never encountered before – or if you have, you never really got it in the first place, and have long since forgotten. Factorising? Finding the locus?Solving for x? Probability distributions? What do these even mean? More Maths for Mums and Dads gives you all the ammunition to help you to help your teenager get to grips with and feel more confident about – and hopefully even enjoy – GCSE maths. It covers in straightforward and easy-to-follow terms the maths your child will encounter in the build up to GCSE, in many cases gives practical and fun examples of where the maths crops up in the real world. In addition, the authors introduce the notion of estimation and coin a new term, Zequals. Using the Zequals method will help develop your teenager's feel for numbers, which in turn could transform their experience and enjoyment of everyday maths.

A modern classic, Einstein's Dreams is a fictional collage of stories dreamed by Albert Einstein in 1905, about time, relativity and physics. As the defiant but sensitive young genius is creating his theory of relativity, a new conception of time, he imagines many possible worlds. In one, time is circular, so that people are fated to repeat triumphs and failures over and over. In another, there is a place where time stands still, visited by lovers and parents clinging to their children. In another, time is a nightingale, sometimes trapped by a bell jar. Now translated into thirty languages, Einstein's Dreams has inspired playwrights, dancers, musicians, and painters all over the world. In poetic vignettes, it explores the connections between science and art, the process of creativity, and ultimately the fragility of human existence.

This book provides a fun, hands-on approach to learning how mathematics and computing relate to the world around us and help us to better understand it. How can reposting on Twitter kill a movie's opening weekend? How can you use mathematics to find your celebrity look-alike? What is Homer Simpson's method for disproving Fermat's Last Theorem? Each topic in this refreshingly inviting book illustrates a famous mathematical algorithm or result--such as Google's PageRank and the traveling salesman problem--and the applications grow more challenging as you progress through the chapters. But don't worry, helpful solutions are provided each step of the way. Math Bytes shows you how to do calculus using a bag of chocolate chips, and how to prove the Euler characteristic simply by doodling. Generously illustrated in color throughout, this lively and entertaining book also explains how to create fractal landscapes with a roll of the dice, pick a competitive bracket for March Madness, decipher the math that makes it possible to resize a computer font or launch an Angry Bird--and much, much more. All of the applications are presented in an accessible and engaging way, enabling beginners and advanced readers alike to learn and explore at their own pace--a bit and a byte at a time.

Technology is ubiquitous, and its potential to transform learning is immense. The first edition of Using Technology with Classroom Instruction That Works answered some vital questions about 21st century teaching and learning: What are the best ways to incorporate technology into the curriculum? What kinds of technology will best support particular learning tasks and objectives? How does a teacher ensure that technology use will enhance instruction rather than distract from it? This revised and updated second edition of that best-selling book provides fresh answers to these critical questions, taking into account the enormous technological advances that have occurred since the first edition was published, including the proliferation of social networks, mobile devices, and web-based multimedia tools. It also builds on the up-to-date research and instructional planning framework featured in the new edition of Classroom Instruction That Works, outlining the most appropriate technology applications and resources for all nine categories of effective instructional strategies: * Setting objectives and providing feedback * Reinforcing effort and providing recognition * Cooperative learning * Cues, questions, and advance organizers * Nonlinguistic representations * Summarizing and note taking * Assigning homework and providing practice * Identifying similarities and differences * Generating and testing hypotheses Each strategy-focused chapter features examples--across grade levels and subject areas, and drawn from real-life lesson plans and projects--of teachers integrating relevant technology in the classroom in ways that are engaging and inspiring to students. The authors also recommend dozens of word processing applications, spreadsheet generators, educational games, data collection tools, and online resources that can help make lessons more fun, more challenging, and--most of all--more effective.
