Daughters of Time

Offering the first general introductory text to this subject, the timely Introduction to Evolutionary Ethics reflects the most up-to-date research and current issues being debated in both psychology and philosophy. The book presents students to the areas of cognitive psychology, normative ethics, and metaethics. The first general introduction to evolutionary ethics Provides a comprehensive survey of work in three distinct areas of research: cognitive psychology, normative ethics, and metaethics Presents the most up-to-date research available in both psychology and philosophy Written in an engaging and accessible style for undergraduates and the interested general reader Discusses the evolution of morality, broadening its relevance to those studying psychology

The Origin and Evolution of Humans and Humanness

Urgent interest in new diseases, such as the coronavirus, and the resurgence of older diseases like tuberculosis has fostered questions about the history of human infectious diseases. How did they evolve? Where did they originate? What natural factors have stalled the progression of diseases or made them possible? How does a microorganism become a pathogen? How have infectious diseases changed through time? What can we do to control their occurrence? ; Ethne Barnes offers answers to these questions, using information from history and medicine as well as from anthropology. She focuses on changes in the patterns of human behavior through cultural evolution and how they have affected the development of human diseases. ; Writing in a clear, lively style, Barnes offers general overviews of every variety of disease and their carriers, from insects and worms through rodent

vectors to household pets and farm animals. She devotes whole chapters to major infectious diseases such as leprosy, syphilis, smallpox, and influenza. Other chapters concentrate on categories of diseases (gut bugs, for example, including cholera, typhus, and salmonella). The final chapters cover diseases that have made headlines in recent years, among them mad cow disease, West Nile virus, and Lyme disease. ; In the tradition of Berton Roueché, Hans Zinsser, and Sherwin Nuland, Ethne Barnes answers questions you never knew you had about the germs that have threatened us throughout human history.

Fusion Foodways of Africa's Gold Coast in the Atlantic Era

This volume makes a vivid and thorough discussion on ethnicity in Africa in terms of history and the management, resolution and prevention of conflicts. The book walks the reader through some examples of ethnic conflicts to prove the universality of ethnic complexities, and cogently advises against any moral and scholarly withdrawal from issues concerning African ethnicity. It also examines efforts ranging from diplomacy, mediation, arbitration, and enforcement to forceful intervention. The discussion commends these efforts but stresses that conflict prevention is the better means of addressing conflict issues in Africa and elsewhere.

World Prehistory

Modern life is full of problems - in individuals and in society too. Increasingly we see damaged and disturbed children, mental health problems, addictions of many kinds, antisocial behavior, and crime, violence and war. So it seems sensible to ask: does life have to be this way? Was it always like this for human beings? We've been around for maybe as much as two million years: surely we didn't evolve to live such difficult and dysfunctional lives? Do We Need To Be So Screwed-Up?! sets out to discover the answer to this question - and finds plentiful evidence to show that, on the contrary, human beings evolved to be naturally egalitarian, cooperative, and peaceful. Indeed, for over 95% of our history - until about 10,000 years ago - that is how we were: kind, cheerful and happy! This is a paradigm-busting re-evaluation of human nature and our potential for happiness.

Sanitation, Latrines and Intestinal Parasites in Past Populations

Many consider Lewis Binford to be the single most influential figure in archaeology in the last half-century. His contributions to the "New Archaeology" changed the course of the field as he argued for the development of a scientifically rigorous framework to guide the excavation and interpretation of the archaeological record. In this book, first published nearly two decades ago, Binford provided students and general readers with an introduction to his challenging and provocative ideas about understanding the human past. Now available again, this important component of Binford's intellectual legacy will convey the drama and intellectual excitement of contemporary archaeology to a new generation of archaeologists and others interested in the field. Throughout the book, Binford questions old ideas and proposes new theories based on his comparative archaeological and

ethnographic research in North America, Europe, South Africa, and Australia. A new afterword by Binford surveys the direction archaeology has taken since the publication of this book and shares his hopes for the future of the discipline.

Saudi Arabia: An Environmental Overview

The hominin fossil record documents a history of critical evolutionary events that have ultimately shaped and defined what it means to be human, including the origins of bipedalism; the emergence of our genus *Homo*; the first use of stone tools; increases in brain size; and the emergence of *Homo sapiens*, tools, and culture. The Earth's geological record suggests that some evolutionary events were coincident with substantial changes in African and Eurasian climate, raising the possibility that critical junctures in human evolution and behavioral development may have been affected by the environmental characteristics of the areas where hominins evolved. *Understanding Climate's Change on Human Evolution* explores the opportunities of using scientific research to improve our understanding of how climate may have helped shape our species. Improved climate records for specific regions will be required before it is possible to evaluate how critical resources for hominins, especially water and vegetation, would have been distributed on the landscape during key intervals of hominin history. Existing records contain substantial temporal gaps. The book's initiatives are presented in two major research themes: first, determining the impacts of climate change and climate variability on human evolution and dispersal; and second, integrating climate modeling, environmental records, and biotic responses. *Understanding Climate's Change on Human Evolution* suggests a new scientific program for international climate and human evolution studies that involve an exploration initiative to locate new fossil sites and to broaden the geographic and temporal sampling of the fossil and archeological record; a comprehensive and integrative scientific drilling program in lakes, lake bed outcrops, and ocean basins surrounding the regions where hominins evolved and a major investment in climate modeling experiments for key time intervals and regions that are critical to understanding human evolution.

African Ethnicity

This volume describes the agricultural and cultural history of the Gold Coast (now, Ghana) in the Atlantic era, exploring the historical significance of new food crops and culinary techniques from the Americas, Asia and elsewhere in Africa to the farmers who produced them and to everybody who ate.

Science and Creationism

Without 3 Miracles Darwins Dead! will settle the question, Is Evolution possible? In the mind of the reader and any intelligent, open-minded person the answer must be, Evolution is IMPOSSIBLE!, because: Evolution is NOT science; its a faith statement about the past! Evolution breaks 3 unbreakable scientific LAWS! Evolution has never been observed in a laboratory or in the field, but Richard Dawkins said. Evolution has been observed. Its just that it hasnt been observed when its happening. In Evolution all the missing links are still missing, In Evolution

there are some creatures whose behavior, design and amazing complexity cant be explained. The history of Evolution contains many frauds. Ill highlight two. How do Evolution proponents explain these issues? Denial, rationalization or just plain lying! Evolution has damaging effects on our culture and wastes valuable resources that could be used to improve health and living conditions, but millions, of our money, is spent on research that can NEVER bring any value to mankind. The answer to the question, Where did we come from? can ONLY be, We are created in Gods image for purpose. We did not come from an explosion of Hydrogen gas and pond scum!

Evolution of Human Behavior

This Very Short Introduction traces the history of paleoanthropology from its beginnings in the eighteenth century to the latest fossil finds. Although concentrating on the fossil evidence for human evolution, it also covers the latest genetic evidence about regional variations in the modern human genome that relate to our evolutionary history. Bernard Wood draws on over thirty years of experience to provide an insider's view of the field and some of the personalities in it, and demonstrates that our understanding of human evolution is critically dependent on advances in related sciences such as paleoclimatology, geochronology, systematics, genetics, and developmental biology. ABOUT THE SERIES: The Very Short Introductions series from Oxford University Press contains hundreds of titles in almost every subject area. These pocket-sized books are the perfect way to get ahead in a new subject quickly. Our expert authors combine facts, analysis, perspective, new ideas, and enthusiasm to make interesting and challenging topics highly readable.

Evolution, Human Behaviour and Morality

Sanitation and intestinal health is something we often take for granted today. However, people living in many regions of the developing world still suffer with debilitating diseases due to the lack of sanitation. Despite its clear impact upon health in modern times, sanitation in past populations is a topic that has received surprisingly little attention. This book brings together key experts from around the world to explore fascinating aspects of life in the past relevant to sanitation, and how that affected our ancestors. By its end readers will realize that toilets were in use in ancient Mesopotamia even before the invention of writing, and that flushing toilets with anatomic seats were a technology of ancient Greece at the time of the minotaur myth. They will see how sanitation compared in ancient Rome and medieval London, and will take a virtual walk around the sanitation of York at the time of the Vikings. Readers will also understand which intestinal parasites infected humans in different regions of the world over different time periods, what these parasites tell us about early human evolution, later population migrations, past diet, lifestyle, and the effects of sanitation technology. There is good evidence that over the millennia people in the past realized that sanitation mattered. They invented toilets, cleaner water supplies, drains, waste disposal and sanitation legislation. While past views on sanitation were very different to those of today, it is clear than many past societies took sanitation much more seriously than was previously thought.

Migration in World History

Do you want to learn about the physical origin of the Universe, but don't have the rest of eternity to read up on it? Do you want to know what scientists know about where you and your planet came from, but without the science blinding you? 'Course you do - and who better than For Dummies to tackle the biggest, strangest and most wonderful question there is! The Origins of the Universe For Dummies covers: Early ideas about our universe Modern cosmology Big Bang theory Dark matter and gravity Galaxies and solar systems Life on earth Finding life elsewhere The Universe's forecast

From Biped to Strider

For one semester or quarter courses in World Prehistory. Written by one of the leading archaeological writers in the world — in a simple, jargon-free narrative style — this brief, well-illustrated account of the major developments in the human past makes world prehistory uniquely accessible to complete beginners. Written by Brian Fagan, World Prehistory covers the entire world, not just the Americas or Europe, and places major emphasis on both theories and the latest archaeological and multidisciplinary approaches. His focus is on four major developments in world prehistory: 1) The origins of humanity. 2) The appearance and spread of modern humans before and during the late Ice Age- including the first settlement of the Americas. 3) The beginnings of food production. 4) The rise of the first civilizations.

The Human Face

This volume represents the proceedings of the Irving Stone Memorial Symposium on "The Origin of Humans and Humanness." Scientists in the fields of anthropology, archaeology, biology and ecology were invited to discuss their research concerning the how's, where's and why's of the evolutionary history of humans. Using our knowledge of the behavior and reproduction of living primates, chapter 1 describes what made the earliest human-like animals of 4 million years ago different from their ape relatives. While showing how the science of paleontology works, the origin of our genus, Homo, is discussed in chapter 2. With emphasis on those humans who first made regular use of stone tools some 2 million years ago, chapter 3 interprets ancient human behavior and ecology from an archeological perspective. Tools from genetics, molecular biology, archaeology and paleontology are used to examine the origin of modern Homo sapiens in chapter 4. Chapter 5 looks at the artistry of Ice Age craftsmen. Finally, using computer methods, chapter 6 delves into the complex issue of how does human behavior change, and what is the relationship between biological and cultural evolution?

Without 3 Miracles, Darwin'S Dead!

Nutrition, Physical Activity, and Health in Early Life is a complete and thorough compilation of scientific information on the growth of young children - much of it previously unavailable. This breakthrough book describes changes in functional, motor, and sensomotor development in young children as related to somatic growth, body composition, and nutrition. Packed with original experimental data

derived from repeated cross-sectional and longitudinal studies, the book presents results that can be used as reference standards. Human studies are supplemented by data from experimental animal models to provide in-depth information on many difficult research areas. Specifically, Nutrition, Physical Activity, and Health in Early Life analyzes the impact of environment, exercise, diet, and prenatal factors on body composition, fat distribution, dietary intake, and blood lipid levels in children 3 to 6 years of age. It also reviews functional development in marginally and severely malnourished and obese children. Written by a leading nutrition researcher who has worked in the field for more than twenty years, this monumental resource provides today's research standards for investigating the complex physical development of young children.

Evolution in Health and Disease

How can we improve support for teachers as they negotiate the pathways into the profession? This book highlights how strong networks of connections with other teachers and with resources have been shown to make a big difference. Online learning networks are one way to help pre-service and early career teachers to foster these connections and the greater community of teachers has an interest in helping new teachers to enter the profession. New technologies have allowed teachers to be connected anywhere, anytime; this book discusses principles for the design and implementation of learning networks that can use this connectivity to improve support for beginning teachers. It addresses foundational principles of types of teacher communities (online and offline), types of knowledge relevant to beginning teachers, the idea of presence within a network and methodologies for studying and nurturing communities of teachers, providing recent examples of each.

Those who Have Vanished

A fully revised edition of a volume written by the world's leading authorities on this subject. It discusses how the evolution of humans and their pathogens have generated important medical issues, covering both infectious and degenerative diseases. It presents important ideas that are not yet sufficiently appreciated in the medical community.

The History of Human Marriage

A history of women in the Western world

Diseases and Human Evolution

A fascinating, detailed study of the origins of modern humans. Includes material from Willoughby's own research in Tanzania.

Online Learning Networks for Pre-Service and Early Career Teachers

James W. Pennebaker The University of Texas at Austin At first glance, a scientific

book on the face doesn't make a great deal of sense. After all, the face is not a biological unit that falls into a specific medical specialty. By the same token, it is not part of a of a specific clear functional system that falls within the purview of a discipline of psychology, philosophy, sociology, or any other traditional area. It seems that the only organizing principle of the face is that all humans have one and that it is central to the experience of being human. As a social stimulus, the face can signal emotions, personality, sex, physical and mental health, social status, age, and aspects of our thoughts, intentions, and our inner selves. At various points in our lives, we spend a tremendous amount of time and money for cosmetics, cleansers, medicines, and, occasionally, surgery to enhance our face. In the same way that a normative, symmetrical face can attract praise and even adoration, damage to the face through birth defects, disease, or injury is almost always stigmatizing. Our faces, then, are social advertisements for who we are.

Sociology

"Traces the history of the invention of the toilet, from the earliest attempts of ancient civilizations to the modern flush toilet design"--

Do We Need To Be So Screwed Up?!

The second edition of *Sport and Spectacle in the Ancient World* updates Donald G. Kyle's award-winning introduction to this topic, covering the Ancient Near East up to the late Roman Empire.

- Challenges traditional scholarship on sport and spectacle in the Ancient World and debunks claims that there were no sports before the ancient Greeks
- Explores the cultural exchange of Greek sport and Roman spectacle and how each culture responded to the other's entertainment
- Features a new chapter on sport and spectacle during the Late Roman Empire, including Christian opposition to pagan games and the Roman response
- Covers topics including violence, professionalism in sport, class, gender and eroticism, and the relationship of spectacle to political structures

Climate, Environment, and Society in the Pacific during the Last Millennium

The application of chemistry within archaeology is an important and fascinating area. It allows the archaeologist to answer such questions as "what is this artefact made of?", "where did it come from?" and "how has it been changed through burial in the ground?", providing pointers to the earliest history of mankind.

Archaeological Chemistry begins with a brief description of the goals and history of archaeological science, and the place of chemistry within it. It sets out the most widely used analytical techniques in archaeology and compares them in the light of relevant applications. The book includes an analysis of several specific archaeological investigations in which chemistry has been employed in tracing the origins of or in preserving artefacts. The choice of these investigations conforms to themes based on analytical techniques, and includes chapters on obsidian, ceramics, glass, metals and resins. Finally, it suggests a future role for chemical and biochemical applications in archaeology. Archaeological Chemistry enables scientists to tackle the fundamental issues of chemical change in the

archaeological materials, in order to advance the study of the past. It will prove an essential companion to students in archaeological science and chemistry, field and museum archaeologists, and all those involved in conserving human artefacts.

Sport and Spectacle in the Ancient World

This edition of Science and Creationism summarizes key aspects of several of the most important lines of evidence supporting evolution. It describes some of the positions taken by advocates of creation science and presents an analysis of these claims. This document lays out for a broader audience the case against presenting religious concepts in science classes. The document covers the origin of the universe, Earth, and life; evidence supporting biological evolution; and human evolution. (Contains 31 references.) (CCM)

The Grimy, Gross Unusual History of the Toilet

Recounts the world-famous paleoanthropologist's attempts to solve the mystery of human evolution, using evidence uncovered during his recent forays into the fossil-rich regions of Eastern Africa. TV tie-in. 35,000 first printing. \$35,000 ad/promo. Tour.

In Pursuit of the Past

This book highlights the recent re-emergence of Edward Westermarck's work in modern approaches to morality and altruism, examining his importance as one of the founding fathers of anthropology and as a moral relativist, who identified our moral feelings with biologically-evolved retributive emotions. Questioning the extent to which current debates on the relationship between biology and morality are similar to those in which Westermarck himself was involved, the authors ask what can be learnt from his arguments and from the criticism that he encountered. Drawing on Westermarck's manuscripts and papers as well as his published work, the authors show the importance of situating debates, whether modern or classical, in their correct methodological and philosophical context. This volume is a rigorous assessment of the ways in which morality is connected with human biological nature. It plays close attention to the development of debates in this field and will appeal to scholars of sociology, anthropology and philosophy.

Ancestors in Our Genome

Threats to biodiversity, food shortages, urban sprawl . . . lessons for environmental problems that confront us today may well be found in the past. The archaeological record contains hundreds of situations in which societies developed long-term sustainable relationships with their environments—and thousands in which the relationships were destructive. Charles Redman demonstrates that much can be learned from an improved understanding of peoples who, through seemingly rational decisions, degraded their environments and threatened their own survival. By discussing archaeological case studies from around the world—from the deforestation of the Mayan lowlands to soil erosion in ancient Greece to the almost total depletion of resources on Easter Island—Redman reveals the long-range

coevolution of culture and environment and clearly shows the impact that ancient peoples had on their world. These case studies focus on four themes: habitat transformation and animal extinctions, agricultural practices, urban growth, and the forces that accompany complex society. They show that humankind's commitment to agriculture has had cultural consequences that have conditioned our perception of the environment and reveal that societies before European contact did not necessarily live the utopian existences that have been popularly supposed. Whereas most books on this topic tend to treat human societies as mere reactors to environmental stimuli, Redman's volume shows them to be active participants in complex and evolving ecological relationships. *Human Impact on Ancient Environments* demonstrates how archaeological research can provide unique insights into the nature of human stewardship of the Earth and can permanently alter the way we think about humans and the environment.

Human Impact on Ancient Environments

The nature of global change in the Pacific Basin is poorly known compared to other parts of the world. *Climate, Environment, and Society in the Pacific during the Last Millennium* describes the climate changes that occurred in the Pacific during the last millennium and discusses how these changes controlled the broad evolution of human societies, typically filtered by the effects of changing sea level and storminess on food availability and interaction. Covering the entire period since AD 750 in the Pacific, this book describes the influences of climate change on environments and societies during the Medieval Warm Period and the Little Ice Age, focusing on the 100-year transition between these - a period of rapid change known as the AD 1300 Event. * Discusses the societal effects of climate and sea-level change, as well as the evidence for externally-driven societal change * Synthesizes how climate change has driven environmental change and societal change in the Pacific Basin * Contains a comprehensive and up-to-date survey of the evidence for climate, environmental, and societal change, supported by a full list of references

Archaeological Chemistry

The inspiration for this volume of contributed papers stemmed from conversations between the editors in front of Chuck Hilton's poster on the determinants of hominid walking speed, presented at the 1998 meetings of the American Association of Physical Anthropologists (AAPA). Earlier at those meetings, Jeff Meldrum (with Roshna Wunderlich) had presented an alternate interpretation of the Laetoli footprints based on evidence of midfoot flexibility. As the discussion ensued we found convergence on a number of ideas about the nature of the evolution of modern human walking. From the continuation of that dialogue grew the proposal for a symposium which we called *From Biped to Strider: the Emergence of Modern Human Walking*. The symposium was held as a session of the 69th annual meeting of the AAPA, held in San Antonio, Texas in 2000. It seemed to us that the study of human bipedalism had become overshadowed by the often polarized debates over whether australo pitheciines were wholly terrestrial in habit, or retained a significant degree of arboreality.

Student Study Guide to The Early Human World

Basics in Human Evolution

In this magisterial work the history of the peoples of Palestine from the earliest times to Alexander's conquest is thoroughly sifted and interpreted. All available source material-textual, epigraphic, and archeological-is considered, and the approach taken aims at a dispassionate reconstruction of the major epochs and events by the analysis of social, political, military, and economic phenomena. The book, chronologically structured, is indispensable for the study of the Hebrew Bible and of the ancient Near East.

Human Evolution: A Very Short Introduction

This book represents an important meeting ground in the primatology field by exploring the various primate models that have been used in the reconstruction of early human behavior. While some models are based on the proposition that a key behavioral feature such as hunting, eating of seeds or monogamous mating led to the evolutionary separation of apes and humans, other models suggest that one primate species, such as the baboon or chimpanzee, best exemplifies the behavior of our early ancestors. Several contributors to the book take the position that no single primate is a good model and contend instead that a model must be eclectic. One of the more innovative essays suggests that ancestral behavioral states can, in fact, be derived by comparing the behavior of all living hominid (ape and human) species. Additionally, several other contributors analyze and discuss the concept of model-making, noting deficiencies in earlier models while offering suggestions for future development. Although it is true that a powerful conceptual model for reconstructing hominid behavior does not yet exist, *The Evolution of Human Behavior: Primate Models* suggests ways one may be constructed based on behavioral ecology and evolutionary theory.

Biocultural Evolution

Geneticist Eugene Harris presents us with the complete and up-to-date account of the evolution of the human genome.

Our Story So Far 6

Scattered references to Australian natives; jealousy, prostitution, conception beliefs; mutilations to attract opposite sex, initiation rites (circumcision, subincision), modesty, arranging marriages, sexual needs.

Ancestors

Basics in Human Evolution offers a broad view of evolutionary biology and medicine. The book is written for a non-expert audience, providing accessible and convenient content that will appeal to numerous readers across the interdisciplinary field. From evolutionary theory, to cultural evolution, this book fills

gaps in the readers' knowledge from various backgrounds and introduces them to thought leaders in human evolution research. Offers comprehensive coverage of the wide ranging field of human evolution Written for a non-expert audience, providing accessible and convenient content that will appeal to numerous readers across the interdisciplinary field Provides expertise from leading minds in the field Allows the reader the ability to gain exposure to various topics in one publication

The History of Ancient Palestine

Understanding Climate's Influence on Human Evolution

In a writing style that will captivate those new to the subject, Boulanger presents an understanding of human biological and cultural evolution that is both scientific and humanistic, in keeping with classic anthropological ideals. The aim of this reasonably priced text is to help students think critically about what being human has been, what it is at present, and what it may be in the future. While the book focuses on the anthropological subfields of biological anthropology and archaeology, information and insights are also drawn from cultural anthropology and anthropological linguistics. Boulanger's absorbing treatment, in contrast to other texts on human evolution, features an opening chapter that seeks to negotiate fairly, without defensiveness or condescension, a pathway for creationists to follow into the topic. The next three chapters provide background on the history of evolutionary science, the biology of inheritance and population change, and primatology. Chapters 5 through 9 focus on human biocultural evolution from the time of the ancestor we share with chimpanzees through the development of agriculture and the founding of states. The last chapter deals with the issue of race how it has affected our interpretation of the past and how it continues to influence the present. In addition to an extensive glossary, the fully illustrated textbook features numerous topic-enhancing sidebars, questions for discussion and review, and student exercises.

The Evolution of Modern Humans in Africa

The Student Study Guide is an important and unique component that is available for each of the eight books in The World in Ancient Times series. Each of the Student Study Guides is designed to be used with the student book at school or sent home for homework assignments. The activities in the Student Study Guide will help students get the most out of their history books. Each Student Study Guide includes chapter-by-chapter two-page lessons that use a variety of interesting activities to help a student master history and develop important reading and study skills.

The Origins of the Universe for Dummies

A comprehensive overview of Saudi Arabia's environment, this volume is a unique and authoritative text on the geological and environmental aspects of Saudi Arabia, a country about which little is known by the outside world. Saudi Arabia is a fascinating country with a long tradition of environmental awareness and

sensitivity, pitted against some of the harshest environments on earth. The book brings together a wide range of published and unpublished material which will be of interest to environmental scientists, geologists, geographers and biologists. A comprehensive bibliography is included. This book will be indispensable for university courses dealing with the Middle East and arid zone environments as well as various regional/environmental courses.

An Introduction to Evolutionary Ethics

Nutrition, Physical Activity, and Health in Early Life

This book traces the connections among regions brought about by the movement of people, diseases, crops, technology and ideas. Drawing on examples from a wide range of geographical regions and thematic areas, noted world historian Patrick Manning guides the reader through the earliest human migrations, including the earliest hominids, their development and spread, and the controversy surrounding the rise of homo sapiens ; the rise and spread of major language groups ; an examination of civilizations, farmers and pastoralists from 3000 BCE to 500 CE ; trade patterns including the early Silk Road and maritime trade in the Mediterrane and more.
