Ohio Report

Crabgrass, Digitaria spp. is a seed propagated summer annual. Native to Europe, it is distributed throughout most tropical and temperate regions of the world; and is ranked as one of the three most serious weeds in those regions.

Some Mountain Pine Beetle Infestation Characteristics in Dwarf Mistletoe-infected and Uninfected Ponderosa Pine

In the aftermath of the pandemic, humanity is on the cusp of extinction as the mutant undead sweep throughout the world. The deadly virus has created a new predator that is far more intelligent and ruthless than anything mankind has ever faced. And the threat from the alphas is increasing as they evolve. Epidemiologist Selene Munroe comes up with a daring solution for gaining a foothold against the deadly virus, but will it be enough to save the human race before it's too late? On another front, CIA operative Will Reisner and his team need to join forces with an unlikely ally to prevent another cyber-attack that could thrust the entire country into the dark ages. Battling legions of parasite-ridden creatures to get to their objective, Reisner finds his resolve stretched to the limit. Loyalties are tested and he must come to grips with a shocking reality that could jeopardize his team's already uncertain future.

Issues in Life Sciences: Acarology, Arachnology, and Entomology: 2011 Edition is a ScholarlyEditions™ eBook that delivers timely, authoritative, and comprehensive information about Life Sciences—Acarology, Arachnology, and Entomology. The editors have built Issues in Life Sciences: Acarology, Arachnology, and Entomology: 2011 Edition on the vast information databases of ScholarlyNews.™ You can expect the information about Life Sciences—Acarology, Arachnology, and Entomology in this eBook to be deeper than what you can access anywhere else, as well as consistently reliable, authoritative, informed, and relevant. The content of Issues in Life Sciences: Acarology, Arachnology, and Entomology: 2011 Edition has been produced by the world’s leading scientists, engineers, analysts, research institutions, and companies. All of the content is from peer-reviewed sources, and all of it is written, assembled, and edited by the editors at ScholarlyEditions™ and available exclusively from us. You now have a source you can cite with authority, confidence, and credibility. More information is available at http://www.ScholarlyEditions.com/.

Mountain Pine Beetle Emergence in Relation to Depth of

Lodgepole Pine Bark

South African Journal of Plant and Soil

Emergence

Tree losses resulting from infestation by the mountain pine beetle (Dendroctonus ponderosae Hopkins) were measured in two stands of lodgepole pine (Pinus contorta Dougl.) where the beetle population had previously been epidemic. Measurement data showed that larger diameter trees were infested and killed first. Tree losses ranged from 1 percent of trees 4 inches (d.b.h.) to 87 percent of those 16 inches and greater d.b.h. Numbers of adult beetle emergence holes averaged 1.3 per square foot of bark area in trees 7 inches d.b.h. and 62 in trees 28 inches and greater d.b.h. The observations indicate that large infestations of mountain pine beetle depend on the presence of large diameter trees within a stand of lodgepole pine, thus implying that beetle population growth is food-limited.
