One of the most widely used ethnographies published in the last twenty years, this Margaret Mead Award winner has been used as required reading at more than 600

colleges and universities. This personal account by a biocultural anthropologist illuminates not-soon-forgotten messages involving the sobering aspects of fieldwork among malnourished children in West Africa. With nutritional anthropology at its core, *Dancing Skeletons* presents informal, engaging, and oftentimes dramatic stories that relate the author's experiences conducting research on infant feeding and health in Mali. Through fascinating vignettes and honest, vivid descriptions, Dettwyler explores such diverse topics as ethnocentrism, culture shock, population control, breastfeeding, child care, the meaning of disability and child death in different cultures, female circumcision, women's roles in patrilineal societies, the dangers of fieldwork, and facing emotionally draining realities. Readers will laugh and cry as they meet the author's friends and informants, follow her through a series of encounters with both peri-urban and rural Bambara culture, and struggle with her as she attempts to reconcile her very different roles as objective ethnographer, subjective friend, and mother in the field. The 20th Anniversary Edition includes a 13-page "Q&A with the Author" in which Dettwyler responds to typical questions she has received individually from students who have been assigned *Dancing Skeletons* as well as audience questions at lectures on various campuses. The new 23-page "Update on Mali, 2013" chapter is a factual update about economic and health conditions in Mali as well as a brief summary of the recent political unrest.

This textbook provides a comprehensive introduction to the concepts and idea of multisensor data fusion. It is an extensively revised second edition of the author's successful book: "Multi-Sensor Data Fusion: An Introduction" which was originally published by Springer-Verlag in 2007. The main changes in the new book are: New Material: Apart from one new chapter there are approximately 30 new sections, 50 new examples and 100 new references. At the same time, material which is out-of-date has been eliminated and the remaining text has been rewritten for added clarity. Altogether, the new book is nearly 70 pages longer than the original book. Matlab code: Where appropriate we have given details of Matlab code which may be downloaded from the worldwide web. In a few places, where such code is not readily available, we have included Matlab code in the body of the text. Layout. The layout and typography has been revised. Examples and Matlab code now appear on a gray background for easy identification and advanced material is marked with an asterisk. The book is intended to be self-contained. No previous knowledge of multi-sensor data fusion is assumed, although some familiarity with the basic tools of linear algebra, calculus and simple probability is recommended. Although conceptually simple, the study of multi-sensor data fusion presents challenges that are unique within the education of the electrical engineer or computer scientist. To become competent in the field the student must become familiar with tools taken from a wide range of diverse subjects including: neural networks, signal processing, statistical estimation, tracking algorithms, computer vision and control theory. All too often, the student views multi-sensor data fusion as a miscellaneous assortment of different processes which bear no relationship to each other. In contrast, in this book the processes are unified by using a common statistical framework. As a consequence, the underlying pattern of relationships that exists between the different methodologies is made evident. The book is illustrated with many real-life examples taken from a diverse range of applications and contains an extensive list of modern references.

This book is suitable for undergraduate students in computer science and engineering, for students in other disciplines who have good programming skills, and for professionals. Computer animation and graphics—once rare, complicated, and comparatively expensive—are now prevalent in everyday life from the computer screen to the movie screen. *Interactive Computer Graphics: A Top-Down Approach with Shader-Based OpenGL®, 6e*, is the only introduction to computer graphics text for undergraduates that fully integrates OpenGL 3.1 and emphasizes application-based programming. Using C and C++, the top-down, programming-oriented approach allows for coverage of engaging 3D material early in the text so readers immediately begin to create their own 3D graphics. Low-level algorithms (for topics such as line drawing and filling polygons) are presented after readers learn to create graphics.

Managing the Human Factor

Human resource departments are key components in the people management system of nearly every medium-to-large organization in the industrial world. They provide a wide range of essential services relating to employees, including recruitment, compensation, benefits, training, and labor relations. A century ago, however, before the concept of human resource management had been invented, the supervision and care of employees at even the largest companies were conducted without written policies or formal planning, and often in harsh, arbitrary, and counterproductive ways. How did companies such as United States Steel manage a workforce of 160,000 employees at dozens of plants without a specialized personnel or industrial relations department? What led some of these organizations to introduce human resources practices at the end of the nineteenth century? How were the earliest personnel departments structured and what were their responsibilities? And how did the theory and implementation of human resources management evolve, both within industry and as an academic field of research and teaching? In *Managing the Human Factor*, Bruce E. Kaufman chronicles the origins and early development of human resource management (HRM) in the United States from the 1870s, when the Labor Problem emerged as

the nation's primary domestic policy concern, to 1933 and the start of the New Deal. Through new archival research, an extensive review and synthesis of the historical and contemporary literatures, and case studies illustrating best (and worst) practices during this period, Kaufman identifies the fourteen ideas, events, and movements that led to the creation of specialized HRM departments in the late 1910s, as well as their further growth and development into strategic business units in the welfare capitalism period of the 1920s. The research presented in this book not only uncovers many new aspects of the early development of personnel and industrial relations but also challenges central parts of the contemporary interpretation of the concept and evolution of HRM. Rich with insights on both the present and past of human resource management, *Managing the Human Factor* will be widely regarded as the definitive account of the early history of employee management in American companies and a must-read for all those interested in the indispensable function of managing people in organizations.
