The bestselling novel—a love story of race and identity—from the award-winning author of *We Should All Be Feminists* and *Dear Ijeawele*. Ifemelu and Obinze are young and in love when they depart military-ruled Nigeria for the West. Beautiful, self-assured Ifemelu heads for America, where despite her academic success, she is forced to grapple with what it means to be black for the first time. Quiet, thoughtful Obinze had hoped to join her, but with post-9/11 America closed to him, he instead plunges into a dangerous, undocumented life in London. Fifteen years later, they reunite in a newly democratic

Nigeria, and reignite their passion—for each other and for their homeland.

In her book, *Jump Into the Kingdom*, author Missy Beik teaches that to the degree we press in and choose to live in His kingdom now, we will experience His wonderful presence, power, and love. The Holy Spirit speaks directly to the reader through *Jump Into the Kingdom* in order to bring a message for today to the twenty-first century church. About the author: Missy Beik has established two Christian preschools and is the founder of Handmaidens In His Service, Inc., of Longwood, Florida, a prayer-based ministry teaching the Bible and encouraging believers in their walk with Christ. She and her husband, Steve, have been married thirty-three years, and they have four children.

The most common document formalisation for text classification is the vector space model founded on the bag of words/phrases representation. The main advantage of the vector space model is that it can readily be employed by classification algorithms. However, the bag of words/phrases representation is suited to capturing only word/phrase frequency; structural and semantic information is ignored. It has been established that structural information plays an important role in classification accuracy [14]. An alternative to the bag of words/phrases representation is a graph based representation, which intuitively possesses much more expressive power. However, this representation introduces an additional level of complexity in that the calculation of the similarity between two graphs is significantly more computationally expensive than between two vectors (see for example [16]). Some work (see for example [12]) has been done on hybrid representations to capture both structural elements (using the graph model) and significant features using the vector model. However the computational resources required to process this hybrid model are still extensive.
