This book provides a practical and self-contained overview of the Gene Ontology (GO), the leading project to organize biological knowledge on genes and their products across genomic resources. Written for biologists and bioinformaticians, it covers the state-of-the-art of how GO annotations are made, how they are evaluated, and what sort of analyses can and cannot be done with the GO. In the spirit of the Methods in Molecular Biology book series, there is an emphasis throughout the chapters on providing practical guidance and troubleshooting advice. Authoritative and accessible, The Gene Ontology Handbook serves non-experts as well as seasoned GO users as a thorough guide to this powerful knowledge system. This text addresses the application of machine vision as a sensor for high-performance control of robot manipulator position. In order to achieve high-performance it is argued that it is necessary to have accurate dynamical models of the system to be controlled (the robot) and the sensor (the camera and vision system). The text provides supporting theory, experimentation and practical coverage of the topic.

Polystyrene represents one of the oldest and the most widespread polymers in the world. Its starts as far back as 1839 when a German apothecary Edmon Simon distilled an oily liquid named styrol from the resin of Turkish sweet gum trees. In several days, the sterol converted into a jelly product that he thought resulted from the oxidation process. For that reason, the jelly product received the name styroloxide. This book discusses the synthesis of polystyrene, as well as the characteristics and applications of this polymer.

Unusual because they involve students above the primary level, the programs described in this report are designed to involve parents more fully in the education of their children. Presented are 28 programs in grades 4-12 initiated by school systems in large cities and operating during the 1980-81 school year. Information about the programs was gathered through telephone conversations and through visits to seven programs. School systems were asked to provide information on programs that might help parents act in educational capacities, such as home tutors, monitors of homework and attendance, or guides for their children in the use of community educational resources. A general discussion section highlights salient features from all programs, promising practices, components of a comprehensive program, and strategies for program development. The 28 program profiles include program objectives, major activities, staffing, target populations, funding, evaluations, materials available, and the name of a contact person. The seven in-depth reports resulting from site visits cover each program's objectives, rationale, development, operation, cost and personnel information, supporting and

inhibiting factors, evidence of success, and other areas. A table classifying the main characteristics of each program assists readers in locating programs of interest. (Author/JM)

basics of serial communications using a USB UART bridge. You will further learn to write a simple terminal program in C# and Visual Basic Express .NET. Part 2 - PC to Microcontroller Conversations -- In the second section you will build on what you have learned and get into more details about GUI programming, using the SerialPort class, and some useful software tools such as XML. You will bring it all together by building a Developer Terminal, which will have most of the bells and whistles that you would want for communicating between a PC and a microcontroller. You will end this section with some neat hardware experiments. Part 3 - The FTDI FT232R -- In the final section you will chuck the serial port paradigm and communicate directly with the FT232R. You will learn how to use the Smiley Micros port of the FTDI D2XX driver, you will do some more hardware experiments bit-banging the BBUSB pins, and finally you will build a software programmer for the FT232R.

The Innovation Manual

Neither an academic tome nor a prescriptive 'how to' guide, The Theory and Practice of Online Learning is an illuminating collection of essays by practitioners and scholars active in the complex field of distance education. Distance education has evolved significantly in its 150 years of existence. For most of this time, it was an individual pursuit defined by infrequent postal communication. But recently, three more developmental generations have emerged, supported by television and

radio, teleconferencing, and computer conferencing. The early 21st century has produced a fifth generation, based on autonomous agents and intelligent, database-assisted learning, that has been referred to as Web 2.0. The second edition of "The Theory and Practice of Online Learning" features updates in each chapter, plus four new chapters on current distance education issues such as connectivism and social software innovations.
