High-dimensional probability offers insight into the behavior of random vectors, random matrices, random subspaces, and objects used to quantify uncertainty in high dimensions. Drawing on ideas from probability, analysis, and geometry, it lends itself to applications in mathematics, statistics, theoretical computer science, signal processing, optimization, and more. It is the first to integrate theory, key tools, and modern applications of high-dimensional probability. Concentration inequalities form the core, and it covers both classical results such as Hoeffding's and Chernoff's inequalities and modern developments such as the matrix Bernstein's inequality. It then introduces the powerful methods based on stochastic processes, including such tools as Slepian's, Sudakov's, and Dudley's inequalities, as well as generic chaining and bounds based on VC dimension. A broad range of illustrations is embedded throughout, including classical and modern results for covariance estimation, clustering, networks, semidefinite programming, coding, dimension reduction, matrix completion, machine learning, compressed sensing, and sparse regression.

Once You Catch The User Experience Bug, the world changes. Doors open the wrong way, websites don't work, and companies don't seem to care. And while anyone can learn the UX remedies---usability testing, personas, prototyping and so on---unless your organization "gets it," putting them into practice is trickier. Undercover User Experience is a pragmatic guide from the front lines, giving frank advice on making UX work in real companies with real problems. Readers will learn how to fit research, idea generation, prototyping and testing into their daily workflow, and how to design good user experiences under the all-too-common constraints of time, budget and culture. "A wonderful, proctical, yet subversive book. Cennydd and James teach you the subtle art of

fighting for---and then designing for---users in a hostile world."---Joshua Porter, co-founder Performable and co-creator of 52 weeksofUX. com

Institutionalization of UX

This book provides an introduction to the mathematical and algorithmic foundations of data science, including machine learning, high-dimensional geometry, and analysis of large networks. Topics include the counterintuitive nature of data in high dimensions, important linear algebraic techniques such as singular value decomposition, the theory of random walks and Markov chains, the fundamentals of and important algorithms for machine learning, algorithms and analysis for clustering, probabilistic models for large networks, representation learning including topic modelling and non-negative matrix factorization, wavelets and compressed sensing. Important probabilistic techniques are developed including the law of large numbers, tail inequalities, analysis of random projections, generalization guarantees in machine learning, and moment methods for analysis of phase transitions in large random graphs. Additionally, important structural and complexity measures are discussed such as matrix norms and VC-dimension. This book is suitable for both undergraduate and graduate courses in the design and analysis of algorithms for data.
