Cases and definitions Square matrix. Any real square matrix  $A$  may be decomposed as  $A = QR$ , where  $Q$  is an orthogonal matrix (its columns are orthogonal unit vectors meaning  $Q^T Q = I$ ) and  $R$  is an upper triangular matrix (also called right triangular matrix, hence the name). If  $A$  is invertible, then the factorization is unique if we require the diagonal elements of  $R$  to be positive.

In mathematics, a matrix (plural matrices) is a rectangular array or table of numbers, symbols, or expressions, arranged in rows and columns. For example, the dimension of the matrix below is  $2 \times 3$  (read "two by three"), because there are two rows and three columns:  $\begin{bmatrix} - & - \\ - & - \end{bmatrix}$ . Provided that they have the same size (each matrix has the same number of rows and the same number of columns as the
